DESCRIPTION:	BMPs (bone morphogenetic proteins) belong to the TGF-beta superfamily of structurally related signaling proteins. Members of this superfamily are widely represented throughout the animal kingdom and have been implicated in a variety of developmental processes. Proteins of the TGF-beta superfamily are disulfide-linked dimers composed of two 12-15 kDa polypeptide chains. As implied by their name, BMPs initiate, promote and regulate bone development, growth, remodeling and repair. In addition to its osteogenic activity, BMP-2 plays an important role in cardiac morphogenesis. It is also expressed in a variety of tissues such as lung, spleen, brain, liver, prostate ovary and small intestine.
APPLICATION:	Western blot: 0.5-2 µg/ml It detects the 14 kDa monomer, 28 kDa dimer, as well as the 58 kDa tetramer of human BMP-2. Note: This information is only intended as a guide. The optimal dilutions must be determined by the user.
