DESCRIPTION:	BMPs (bone morphogenetic proteins) belong to the TGF-beta superfamily of structurally related signaling proteins. Members of this superfamily are widely represented throughout the animal kingdom and have been implicated in a variety of developmental processes. Proteins of the TGF-beta superfamily are disulfide-linked dimers composed of two 12-15 kDa polypeptide chains. As implied by their name, BMPs initiate, promote and regulate bone development, growth, remodeling and repair. In vivo studies have shown that BMP-3 can independently induce cartilage formation.
APPLICATION:	Western blot: 0.5-4 µg/ml

Western blot analysis of BMP-3 expression in 3T3 cell lysate.
