

Anti-H3R2me1 Antibody

CATALOG NO.: **A2030-100 (100 µl)**

BACKGROUND DESCRIPTION: Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. Nucleosomes consist of approximately 146 bp of DNA wrapped around a histone octamer composed of pairs of each of the four core histones (H2A, H2B, H3, and H4). The chromatin fiber is further compacted through the interaction of a linker histone, H1, with the DNA between the nucleosomes to form higher order chromatin structures. This gene is intronless and encodes a replication-dependent histone that is a member of the histone H3 family. Transcripts from this gene lack poly A tails; instead, they contain a palindromic termination element. This gene is located separately from the other H3 genes that are in the histone gene cluster on chromosome 6p22-p21.3.

Western blot analysis of H3R2me1 expression in HeLa cells and H3 protein. HRP-conjugated goat anti-rabbit IgG (H+L) was used as secondary antibody at 1:10000 dilution. 25 µg of lysates/proteins were loaded per lane. 3% nonfat dry milk in TBST was used as blocking buffer.

Dot-blot analysis of methylation peptides using Anti-H3R2me1 antibody at 1:1000 dilution.

Immunofluorescence analysis of 293T cells using Anti-H3R2me1 antibody. Blue: DAPI for nuclear staining.
